Appendix	-----Page 13

Our design journey consisted of mainly refining the look and navigation experience of our solution. After brainstorming many different ideas, we settled on developing a browser extension as it fulfilled our goals of simplicity and accessibility. The initial concept sketches featured multiple steps and prompts to guide users, but once we transitioned to Figma, our ideas became easier to visualize and iterate on. Through that we maintained our goals by moving around steps and keeping early iterations black and white.

Progress was largely driven by depending on user testing, demographic research, and analysis of competitors, as well as the market. Below is a breakdown of each prototype stage and what we learned:

First Prototype

A basic mockup for brainstorming, showing only the process of highlighting articles and how information would pop up. It included no logo or colour but tested the idea of bias colour-coding.

Second Prototype – Low-Fidelity

Grayscale design with a basic login/register feature, sign-in process, overlays, and simple pop-ups. It introduced a basic logo and was used for our first round of navigation testing.

Third Prototype – Mid-Fidelity

Added more detailed login/register steps, the extension download process, onboarding with a demo and customization options, search and highlight features, improved graphics, colour-coded bias indicators, and guidance pop-ups. This version was used in a second round of user testing.

Fourth Prototype – High-Fidelity

Fully fleshed out version with refined onboarding, polished search/highlight features, reorganized bias analysis pop-ups, a new logo and colour scheme, and a less intrusive extension presence that appears only at key moments during a user's browsing.

The main catalyst for all the prototype iterations were the feedback and results from our user testing processes. We continued doing walkthroughs to test how efficient each feature and overall experience was. We used affinity mapping and thematic analysis to identify key areas of focus, especially clarity, navigation, and simplicity.

We improved user experience by condensing steps, streamlining the onboarding process, and allowing space for error correction. The bias analysis overlays were restructured to reduce information overload, with visuals and layout playing a key role in readability. We also adjusted the extension's behaviour to be more intuitive, so it would assist without interrupting the natural flow of browsing. Each change made was rooted from a commitment to meaningful user engagement and ensuring our solution remained accessible, helpful, and innovative.

Research Process & Insights

During our iteration processes for Perspectives.ai, primary and secondary research was further expanded on, to successfully implement mentor feedback and user testing insights within our High-Fidelity Prototype. To begin, mentor feedback encouraged justification surrounding our service platform being a web-browser extension and its impact on our target users of young adults, in which previous iterations focused on distributing Perspectives.ai to detect potential biases on social media platforms. Moreover, our previous research explored news media bias within social media platforms however the feasibility of a web-browser based service solution lacked validity due a large portion of social media consumption being on smartphones compared to laptop devices. Thus, frequent feedback regarding the disconnect of our target's needs of detecting bias within social media and providing a web-based solution, guided our group to pivot by focusing on a different target group of university students utilizing laptop devices for their academic needs. In which, secondary research revealed the impact of web-browser solutions on university students utilizing their laptop devices for various academic needs (*Day, 2021*). Furthermore, research has revealed a positive impact of obtaining laptop devices for university students as it provides a platform to explore various academic sources when conducting online research. (*Deveci, 2018*). However, when looking at our target consumers we wanted to ensure we were providing a tool that was effective for university students within educational settings, in which research revealed limitations surrounding university students ability to recognize misinformation when consuming information online (*Nygren, 2020*). This allowed us to address mentor feedback regarding the value of Perspectives.ai, as our features provide users with the ability to detect micro and macro levels of information through our highlighting feature, in which Perspectives.ai allows users to gain a critical understanding through alternate sources provided from our service platform.

Additionally, primary research was conducted to successfully address the feasibility of our service platform for university students academic needs. Thus, through usability testing (*Appendix pg. 32-34*), and qualitative data methods (*Appendix pg. 23*), feedback revealed how users valued a straightforward onboarding process, comfortable navigation, and easy access to the prototype features. Following this the High-Fidelity Prototype was iterated on to be utilized with or without the need to log in to a personal account, users now being able to access Perspectives.ai through the browser extension tab which was not applicable before, and users obtaining the Perspectives.ai action icon for quick access to the highlighting and general Perspectives.ai features. Moreover, user testing feedback addressed the feasibility of Perspectives.ai, with users appreciating the ability to recognize potential biases on a micro level through utilizing the highlighting feature of Perspectives.ai. Thus, the insights gained from our mentors and user-testing allowed us to refine our service platform to support our users and allow them to confidently engage with certain media information, whilst achieving balanced media information during their everyday browsing experiences.

Throughout the stages of development our team has placed a major focus on ensuring the product is both feasible and realistic. Taking advantage of the recently emerging technologies of large language models, our solution leverages these technologies as an artificial second opinion, a system to evaluate the levels of bias and misinformation within a given set of text (either highlighted or the entire article). This makes for a relatively basic system beyond the LLM itself, as the extension need only function as a portal between the user and the server hosting the LLM, by gathering and sending information to the back end as well as receiving and displaying the server's response.

As mentioned in previous submissions the team's eventual goal of developing our own language model is not yet realistic but something we expect may happen further down the line. With the development of tools such as IBM's Watson and other AI training models, it is becoming more and more feasible for Perspectives.ai to eventually go the route of producing its own AI, especially when considering the potential for outside help.

Using feedback from both our professors as well as the mentors at IBM we chose to develop a solution that we could host locally, allowing for greater control and transparency of the technology. Alongside this hosting locally allows it to much easier control the costs associated with the API calls made by our extension rather than outsourcing that responsibility.

In regards to the service blueprint, we created a very simple and easy to understand visual, with labelled sections such as the user actions, front stage and backstage, as well as the line of interaction and line of visibility. Being a browser extension we acknowledge that there are considerably less touch points in comparison to a traditional business such as Amazon or a grocery store. Considering this, we attempted to identify each and every user action and associated stage in the user journey. These sections were broken up into 5 key stages: Awareness, Consideration, Discovery, Usage and Loyalty, each covering their own user actions.

Key touch points are organized in order as follows:

- Experiences a problem or frustration:
 - The user encounters a challenge or pain point that motivates them to seek a solution (ex: confusion due to conflicting information).
- Recalls brand or product awareness moment
 - The user remembers seeing or hearing about Perspectives.ai, often through marketing or recommendation from friends or family.
- Searches for the product or service
 - The user actively seeks out the service by visiting an extension store such as chrome or firefox.
- Explores the product listing
 - The user reviews the listing for the extension, reading descriptions, features, and visual previews setup to display how it works.
- Reads user reviews and feedback
 - The user considers the experiences of others to assess credibility, competition and value the extension provides.
- Downloads or installs the product
 - After being convinced of its value, the user takes the first big action by downloading or installing the Perspectives.ai.
- Completes onboarding and personalization
 - The user provides information and customizes settings to tailor the experience to their specific needs.
- Engages with educational content (tutorials, demos)
 - To maximize value, the user is given a walkthrough to understand how to effectively use the extension and its various features.

Key Touch Points Continued..

- Begins using the product in context
 - The user integrates the product into their regular workflow (e.g., research, studying, browsing).
- Uses product features to solve a real problem
 - The user interacts with the product's core functions to achieve their goal (ex: analyzing bias, comparing perspectives).
- Sees value and positive outcomes from use
 - The user experiences noticeable benefits or results (ex: better grades, deeper understanding).
- Becomes a loyal user and advocate
 - Satisfied with their experience, the user continues to use the Perspectives.ai and recommends it to others.
- Upgrades or makes a purchase
 - The user sees enough value to invest in the pro or premium version to get access to more features of the extension.
- Applies learning to new situations
 - The user now actively identifies issues (like bias) based on insights gained from the product, reinforcing long term value

In regards to the support processes shown in the Service Blueprint, there are a few supporting features. Primarily it would be the behind the scenes done by our team, completing tasks such as monitoring user traffic and usage, updating advertisements and SEO ranking to stay relevant and maintain growth, alongside maintenance of the physical server. Other than these, simple background tasks carried out by the extension and the back end server are managed and processed, such as payments and user information and preferences stored locally in the extension on the users browser.

Prototype and Execution

See Appendix for all Figures

All prototyping for our solution was done using Figma. Since we were designing a browser extension, digital prototyping allowed us to better visualize interactive elements in context. We began with a few paper sketches to map the user journey (*Appendix pg. 24*), then transitioned to Figma to create low- to high-fidelity prototypes. This shift allowed us to explore layout, interactivity, and navigation flow more effectively, particularly how features would appear and behave in a real browser environment.

As we refined our prototypes, we tested the main features such as the article-highlighting tool (*Appendix pg. 25*), the sign-in and registration pages (*Appendix pg. 26*), and the guiding pop-ups (*Appendix pg. 26-27*). This helped us assess how noticeable and intuitive each element would be on a user's screen. Feedback revealed the need for more customization, visual clarity, and transparency. In response, we expanded our onboarding process to include clearer instructions, visual cues, and more flexible user settings (*Appendix pg. 27*). On further user testing we decided to simplify the customizing features as we pivoted our demographic and integrated more in our bias detection and analysis.

We also emphasized key visual elements such as our logo (*Appendix pg. 28*) to improve visuals and emphasize the presence of the solution in a natural browsing experience. Our bias detector was enhanced with an improved scale to offer more specific insights, and we reorganized content panels to prioritize readability and reduce cognitive load (*Appendix pg. 28*). These design choices helped reinforce our values and goals. By responding directly to user feedback, our high-fidelity prototype clarified our purpose and made our solution stand out from competitors while staying aligned with our users' needs.

User Personas

DYLAN

PROFILE

Gender : Male
Age : 21
Education : Political Science Major
Occupation : University Student
Location : Toronto

PAIN POINTS

- Struggles with finding balanced news sources
- Feels overwhelmed by misinformation on social media

GOALS AND EXPECTATIONS

- Be well informed and prepared for debates and discussions in class
- Seeks credible sources that aren't overly biased
- Easily find credible sources without searching through tons of biased articles first
- Find an easy, time-efficient way to compare perspectives without doing manual research

BEHAVIOUR

- Actively follows and engages with political news on Twitter, Reddit and Youtube
- Subscribes to multiple news sources but struggles with knowing which are biased
- Regularly uses fact-checking software like Snopes and FactCheck.org
- Participates in university discussions, debates and social activism groups
- Reads comment sections to gauge different perspectives, especially of differing opinions

OPPORTUNITY / HOW PRODUCT OR SERVICE HELPS

- Highlights level of bias in articles and other media sources to quickly assess credibility
- Suggests alternative sources with different perspectives that save time in research process
- Provides quick summary of bias trends without overwhelming user with information
- Gives user control over depth of analysis, allowing him to highlight sections for detailed breakdowns of the text

RACHEL

PROFILE

Gender : Female
Age : 25
Education : Bachelor's Degree
Occupation : Nurse
Location : Waterloo

PAIN POINTS

- Encounters medical misinformation on social media
- Can't tell the difference between fake AI generated news

GOALS AND EXPECTATIONS

- Stay up to date with global healthcare news
- Improving digital literacy to understand which media is AI generated
- Avoid AI-generated / misleading articles, especially during health outbreaks

BEHAVIOUR

- Subscribes to healthcare journals or newsletters to stay updated on healthcare trends
- Engages in discussions about AI in healthcare with peers
- Educates patients on misleading information on the internet
- Scrolls through social media during long shift breaks and views lots of medical related posts
- Follows healthcare influencers to stay engaged about relatable work

OPPORTUNITY / HOW PRODUCT OR SERVICE HELPS

- Highlights biased, AI-generated, or misleading information in health news to help her make informed decisions
- Saves user time by providing a quick credibility check
- Gives user a different perspective to political news that impacts the healthcare industry

User Personas

ALEX

PROFILE

Gender : Non Binary
Age : 26
Education : Bachelor's Degree
Occupation : Elementary Science Teacher
Location : Sudbury

PAIN POINTS

- Educating students on the disinformation on social media
- Having biased / sources for writing papers
- Finding un-biased sources for reliable information

GOALS AND EXPECTATIONS

- Teach students how to identify reliable information
- Provide honest and transparent classroom content
- Avoid spreading misinformation to students
- Stay informed on science education trends

BEHAVIOUR

- Reads science and education related news to keep up with changing trends
- Follows and engages with other teachers on social media, like Twitter threads
- Uses fact checkers like Snopes before incorporating information to lesson plans
- Watches televised news in the evenings and receives article news from Snopes

OPPORTUNITY / HOW PRODUCT OR SERVICE HELPS

- Teach students how to use service to get perspectives on information
- Identifies bias in science related news to make researching for lesson plans easier
- Suggests diverse sources to provide many perspectives easily accessible in one place

MVP VIDEO Storyboard

Appendix

User Journey Map

Stakeholder Map

As displayed within the system map, relationships between stakeholders have been identified to better understand bias in news media, and the interactions between various stakeholders.

System Map Legend:

- Primary Stakeholders
- Secondary Stakeholders
- Background Stakeholders
- Unbiased relationship
- - - - -> Bias at play

The **direction of the arrow** indicates the dependency of a stakeholder on the other.

Key Primary Stakeholders

System Map Legend:

- Primary Stakeholders
- Secondary Stakeholders
- Background Stakeholders
- Unbiased relationship
- - - - - Bias at play

The **direction of the arrow** indicates the dependency of a stakeholder on the other.

Key Potential B2B Stakeholders

System Map Legend:

- Primary Stakeholders
- Secondary Stakeholders
- Background Stakeholders
- Unbiased relationship
- - → Bias at play

The **direction of the arrow** indicates the dependency of a stakeholder on the other.

User testing for prototype:

Usability testing instructions:

We are aiming to better understand our web-extensions usability, target demographics behaviour, target demographic preferences, and needs. Moreover, from the usability test we hope to identify any issues surrounding our web-extension and how we can improve it.

Usability test setup:

- We will perform this test through a remote process, and will be an moderated test.
- Please make sure to follow the testing process for consistency throughout our testing.
- Our participants are aimed at students.
- We are hoping to better understand how our users are interacting with our web-extension, and additionally gain feedback.
- Before the start of the usability test, participants will be asked for their permission to record the session and obtain the ability to leave at any-time during the test.

Usability test preparations:

- Take the time to go through our prototype to make sure it is functioning smoothly.
- Whilst conducting the usability test please make sure to take general notes of any observations, behaviours, thoughts, or feedback during the usability testing.
- Make sure all technical aspects of the session are working prior to the usability test, making sure the mic is clear for both the moderator and participant.

Usability test procedure:

1. The test will begin by reading the "Test script" to the participant.
 - a. The participant will be recorded after the test script is completed.
2. The prototype link will then be sent to the participant. [Link](#) (Please make sure to tell the participant to fill screen so that they can view the prototype properly)
 - a. Let the participant know that the prototype simply functions by clicking through the screens.
 - b. Please inform the user of how the prototype works if they are unfamiliar with prototype interactions.
 - c. Ask the participant to **share their screen** once they open the prototype to better understand their interactions or provide assistance if help is needed.
3. Remind the participant to act natural throughout the test.
 - a. Encourage the participants to navigate through the prototype how they normally would when researching for educational purposes.
 - b. Encourage the participants to think out loud, and verbalize any thoughts they may have, and how certain aspects of the prototype makes them feel specifically in educational settings.
4. The "Test plan" will then be read to the participant.
5. Begin the test and subtly guide the user throughout the process.
 - a. Please make sure the recording function has been turned on.
 - b. Please make sure the participant shares their screen after the prototype is successfully opened.
 - c. The participant can end the screen sharing once they have navigated through the entire prototype.
6. Have the user complete the SUS survey

7. After the "Test plan" the participant will be asked the "Follow-up questions."
8. After follow-up questions are completed thank the participant and end the recording.

Test script:

Hello!

Thank you for joining me today, and taking the time to participate in our usability test for our prototype. So as you may have been informed this session is being conducted for a university project, in which we are hoping to explore the various ways to tackle bias. In collaboration with my group and I, you will be helping us gain further insights about our project, where we are exploring the presence of bias in the media.

For today, your main task will be to interact with our prototype being a web-extension that has been designed to aid students in detecting bias within their educational activities. Upon interacting with the prototype we would like you to imagine how you would feel as someone who may use our web-extension for certain research processes within an educational setting, and how our tool is able to fulfil this need to successfully understand forms of bias within the media. Please remember that we are testing our web-extension, and not how well you are able to navigate through the prototype as your feedback will help us to further improve aspects of the bias detection tool.

Test plan script:

1. With the prototype opened, try to imagine how you would feel utilising the web-extension for research purposes.
2. Remember, there is no right or wrong way, just explore how you naturally would during a research process.
3. Please try to think out loud and talk throughout your walk-through with the prototype. Share any thoughts you may be having or expectations that may arise during your interactions.
4. We will be here to guide you, but will still leave room for you to interact with the prototype.
5. Now, with your permission we would like to record the session, please let us know if that is okay with you [Participant Answers]. Remember, can you opt out at any time during the usability test if need be.
6. Now, I will begin recording our session, and with the prototype opened please share the screen of only the prototype screen and begin! You can stop sharing your screen, once you have completed your navigation with the prototype.
7. You will start with the onboarding process of the prototype and continue to the service of our prototype.

Follow-up questions after usability test:

1. Now that you have navigated through the prototype we would like you to share general thoughts, and feelings you had during your experience.
 - a. Answer
2. Did you have any moments of confusion upon navigating through the prototype?
 - a. Answer
3. Did you have any expectations upon navigating through the prototype?
 - a. Answer
4. What were your feelings surrounding the prototype's features?
 - a. Answer
5. How was the experience of utilising the prototype for research purposes?
 - a. Answer
6. Any last thoughts regarding the prototype?
 - a. Answer
7. This is the end of the usability test, thank you so much for your time during this process. We are very appreciative of your time, and all the feedback provided. Thank you!
